

ShopSphere

S0 - Foundation and Engineering Baseline

Admin Portal

Platform-Specific Sprint Planning Document

This document intentionally defines only the behavior and delivery scope of the selected platform. It does not mix implementation details from the other platforms.

1. Sprint Definition

Sprint: S0 - Foundation and Engineering Baseline

Platform: Admin Portal

Application: ShopSphere

Objective: Create the React admin foundation and protected application shell without implementing business operations.

This sprint is complete only when the stated use cases, acceptance criteria and tests pass for this platform.

2. Business Use Cases

ID	Use Case	Actor	Precondition	Main Flow	Expected Result
UC-AD-00-01	Launch admin	Admin operator	Application is built	Load configuration and render login/entry route	Admin application loads without business data.
UC-AD-00-02	Handle protected route	Admin operator	Route is marked protected	Evaluate auth state, redirect unauthenticated session	Protected route never renders protected content to unauthenticated users.

3. Detailed Implementation Plan

1. Create admin repository and TypeScript configuration.
2. Create router and application layout.
3. Create API client and error mapping.
4. Create protected route abstraction.
5. Create permission-aware navigation contract.
6. Create reusable table, form, modal and confirmation primitives.
7. Configure unit/component tests and CI.

4. Data / State / Contract Scope

- No admin business tables; future identity data is owned by backend.

API / Integration Contract

- GET /health through typed API client

5. Rules and Expected Behavior

- The platform must rely on the backend as the source of truth for business rules.
- Do not expose stack traces, secrets or internal implementation details to end users.
- Handle loading, empty, validation and error states explicitly.
- Requests that can be retried must be safe from duplicate side effects where the feature requires idempotency.
- Ownership and authorization must be checked server-side for protected data.

6. Acceptance Criteria

- Admin build succeeds.
- Protected routes cannot render without authenticated state.
- Shared components are reusable and tested.
- CI validates lint/type-check/test/build.

7. Test Cases

TC	Scenario	Expected Result
TC-S0-01	Direct protected URL	Operation is handled according to the defined business rule; no incorrect state or security leak is produced.

TC	Scenario	Expected Result
TC-S0-02	API timeout	Operation is handled according to the defined business rule; no incorrect state or security leak is produced.
TC-S0-03	Invalid environment	Operation is handled according to the defined business rule; no incorrect state or security leak is produced.
TC-S0-04	Render empty table	Operation is handled according to the defined business rule; no incorrect state or security leak is produced.
TC-S0-05	Form validation	Operation is handled according to the defined business rule; no incorrect state or security leak is produced.
TC-S0-06	Build failure	Operation is handled according to the defined business rule; no incorrect state or security leak is produced.

8. Sprint Exit Checklist

- Implementation completed only for this platform.
- All primary and negative use cases pass.
- API contracts are implemented/consumed as defined.
- Validation and authorization tests pass.
- Loading/empty/error handling is verified where applicable.
- No critical or blocker defect remains.
- Automated tests pass in CI.
- Documentation and contract changes are committed.

9. Out of Scope for This Document

- Implementation behavior of Backend + DB. That behavior belongs in the separate S0 document for that platform.
- Implementation behavior of Customer Portal. That behavior belongs in the separate S0 document for that platform.
