

# ShopSphere

## S3 - Category Management and Navigation

Admin Portal

Platform-Specific Sprint Planning Document

This document intentionally defines only the behavior and delivery scope of the selected platform. It does not mix implementation details from the other platforms.

# 1. Sprint Definition

Sprint: S3 - Category Management and Navigation

Platform: Admin Portal

Application: ShopSphere

Objective: Implement only the admin-web behavior relevant to Category Management and Navigation; do not implement customer behavior in this document.

This sprint is complete only when the stated use cases, acceptance criteria and tests pass for this platform.

## 2. Business Use Cases

| ID    | Use Case          | Actor    | Precondition                  | Main Flow                     | Expected Result                                 |
|-------|-------------------|----------|-------------------------------|-------------------------------|-------------------------------------------------|
| UC-01 | Create category   | Admin    | Authorized role               | Enter category metadata, save | Category becomes available according to status. |
| UC-02 | Browse categories | Customer | Category exists and is active | Open category navigation      | Active hierarchy is displayed.                  |

## 3. Detailed Implementation Plan

1. Implement category tree/list, create, edit, activate/deactivate and safe-delete.
2. Validate duplicate name/slug and hierarchy rules.

## 4. Data / State / Contract Scope

- No direct database changes. Data is accessed through backend APIs.

### API / Integration Contract

- Consume the corresponding secured /api/v1 admin/customer operational APIs defined by the backend sprint document.

## 5. Rules and Expected Behavior

- The platform must rely on the backend as the source of truth for business rules.
- Do not expose stack traces, secrets or internal implementation details to end users.
- Handle loading, empty, validation and error states explicitly.
- Requests that can be retried must be safe from duplicate side effects where the feature requires idempotency.
- Ownership and authorization must be checked server-side for protected data.

## 6. Acceptance Criteria

- Only authorized admin roles can access the feature.
- Admin UI reflects server state and permission boundaries.
- Validation, loading, empty, error and confirmation states are implemented where relevant.
- No customer UI behavior is defined in this document.

## 7. Test Cases

| TC       | Scenario           | Expected Result                                                                                               |
|----------|--------------------|---------------------------------------------------------------------------------------------------------------|
| TC-S3-01 | Duplicate slug     | Operation is handled according to the defined business rule; no incorrect state or security leak is produced. |
| TC-S3-02 | Self-parent        | Operation is handled according to the defined business rule; no incorrect state or security leak is produced. |
| TC-S3-03 | Circular hierarchy | Operation is handled according to the defined business rule; no incorrect state or security leak is produced. |
| TC-S3-04 | Inactive parent    | Operation is handled according to the defined business rule; no incorrect state or security leak is produced. |

| TC       | Scenario                      | Expected Result                                                                                               |
|----------|-------------------------------|---------------------------------------------------------------------------------------------------------------|
| TC-S3-05 | Delete category with products | Operation is handled according to the defined business rule; no incorrect state or security leak is produced. |
| TC-S3-06 | Empty category                | Operation is handled according to the defined business rule; no incorrect state or security leak is produced. |
| TC-S3-07 | API timeout                   | Operation is handled according to the defined business rule; no incorrect state or security leak is produced. |

## 8. Sprint Exit Checklist

- Implementation completed only for this platform.
- All primary and negative use cases pass.
- API contracts are implemented/consumed as defined.
- Validation and authorization tests pass.
- Loading/empty/error handling is verified where applicable.
- No critical or blocker defect remains.
- Automated tests pass in CI.
- Documentation and contract changes are committed.

## 9. Out of Scope for This Document

- Implementation behavior of Backend + DB. That behavior belongs in the separate S3 document for that platform.
- Implementation behavior of Customer Portal. That behavior belongs in the separate S3 document for that platform.
