

ShopSphere

S3 - Category Management and Navigation

Customer Portal

Platform-Specific Sprint Planning Document

This document intentionally defines only the behavior and delivery scope of the selected platform. It does not mix implementation details from the other platforms.

1. Sprint Definition

Sprint: S3 - Category Management and Navigation

Platform: Customer Portal

Application: ShopSphere

Objective: Implement the customer-facing Category Management and Navigation behavior for iOS, Android and Web.

This sprint is complete only when the stated use cases, acceptance criteria and tests pass for this platform.

2. Business Use Cases

ID	Use Case	Actor	Precondition	Main Flow	Expected Result
UC-01	Create category	Admin	Authorized role	Enter category metadata, save	Category becomes available according to status.
UC-02	Browse categories	Customer	Category exists and is active	Open category navigation	Active hierarchy is displayed.

3. Detailed Implementation Plan

1. Implement category tree/list and category navigation.
2. Handle inactive/empty categories, loading and failure states.

4. Data / State / Contract Scope

- No direct database changes. Data is accessed through backend APIs.

API / Integration Contract

- Consume the corresponding /api/v1 feature APIs defined by the backend sprint document.

5. Rules and Expected Behavior

- The platform must rely on the backend as the source of truth for business rules.
- Do not expose stack traces, secrets or internal implementation details to end users.
- Handle loading, empty, validation and error states explicitly.
- Requests that can be retried must be safe from duplicate side effects where the feature requires idempotency.
- Ownership and authorization must be checked server-side for protected data.

6. Acceptance Criteria

- Customer journey is complete on iOS, Android and Web where the feature applies.
- UI consumes backend responses rather than duplicating business calculations.
- Loading, empty, validation and error states are implemented.
- Unauthorized or stale data is handled safely.

7. Test Cases

TC	Scenario	Expected Result
TC-S3-01	Duplicate slug	Operation is handled according to the defined business rule; no incorrect state or security leak is produced.
TC-S3-02	Self-parent	Operation is handled according to the defined business rule; no incorrect state or security leak is produced.
TC-S3-03	Circular hierarchy	Operation is handled according to the defined business rule; no incorrect state or security leak is produced.
TC-S3-04	Inactive parent	Operation is handled according to the defined business rule; no incorrect state or security leak is produced.
TC-S3-05	Delete category with products	Operation is handled according to the defined business rule; no incorrect state or security leak is produced.

TC	Scenario	Expected Result
TC-S3-06	Empty category	Operation is handled according to the defined business rule; no incorrect state or security leak is produced.
TC-S3-07	API timeout	Operation is handled according to the defined business rule; no incorrect state or security leak is produced.

8. Sprint Exit Checklist

- Implementation completed only for this platform.
- All primary and negative use cases pass.
- API contracts are implemented/consumed as defined.
- Validation and authorization tests pass.
- Loading/empty/error handling is verified where applicable.
- No critical or blocker defect remains.
- Automated tests pass in CI.
- Documentation and contract changes are committed.

9. Out of Scope for This Document

- Implementation behavior of Backend + DB. That behavior belongs in the separate S3 document for that platform.
- Implementation behavior of Admin Portal. That behavior belongs in the separate S3 document for that platform.
